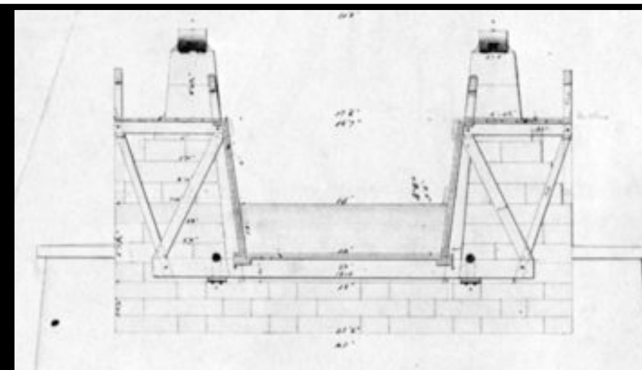
Sixth Street Bridge (1860) 344 ft spans
John A. Roebling Pittsburgh



The original idea upon which the plan has been perfected, was to form a *wooden trunk*, strong enough to support its own weight, and stiff enough for an aqueduct or bridge, and to combine this structure with wire cables of a sufficient strength to bear safely the great weight of water.

LONG AND SHORT SPAN RAILWAY BRIDGES.

BY

JOHN A. ROEBLING,

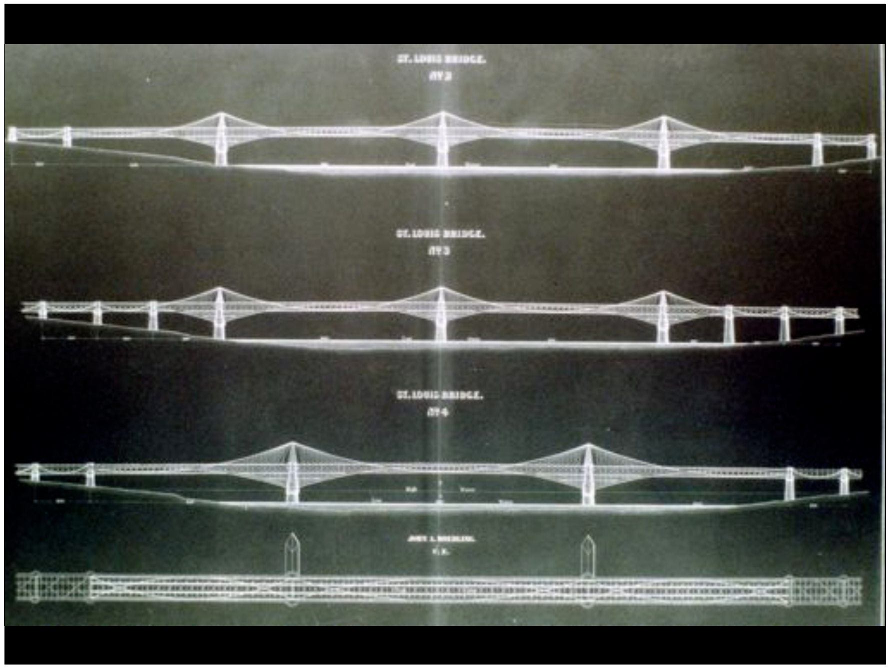
CIVIL ENGINEER.

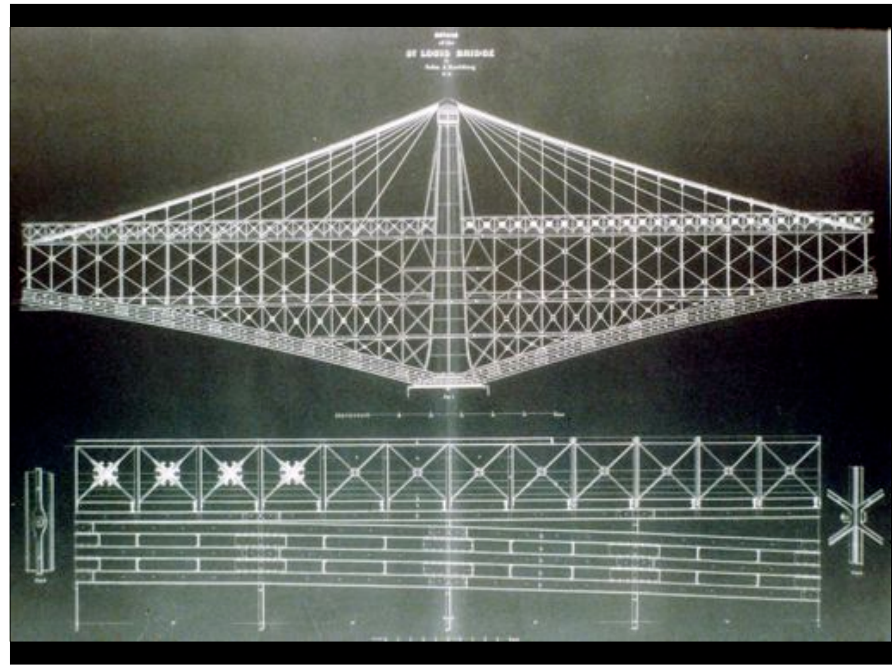
The greatest economy in Bridging can only be obtained by a judicious application of the Parabolic Truss.

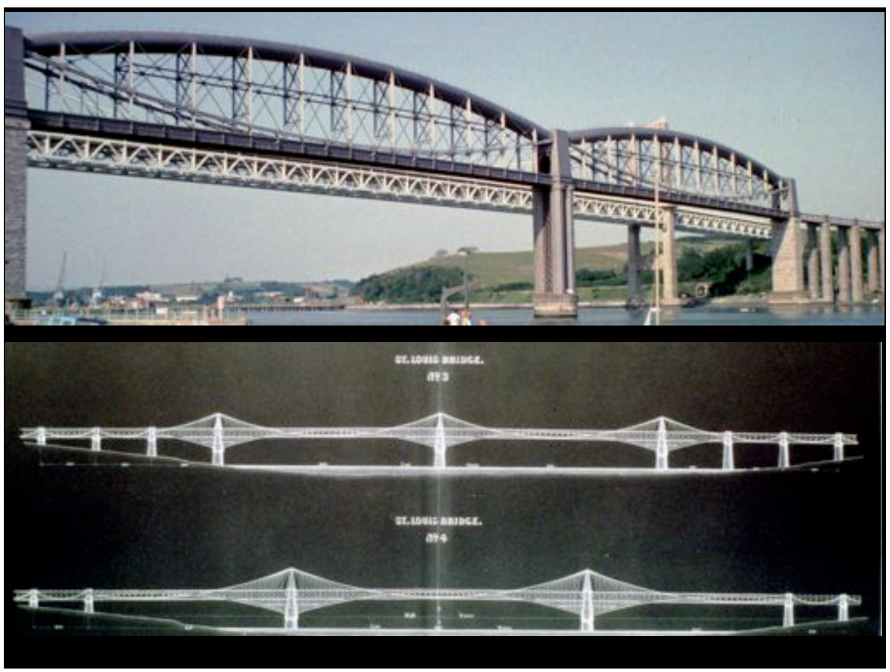
NEW YORK:

D. VAN NOSTRAND, PUBLISHER,

23 MURRAY STREET & 27 WARREN STREET.



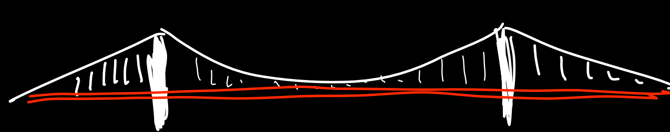




What is one method for imparting stiffness to a suspension bridge?

What are the aesthetic implications of this method?

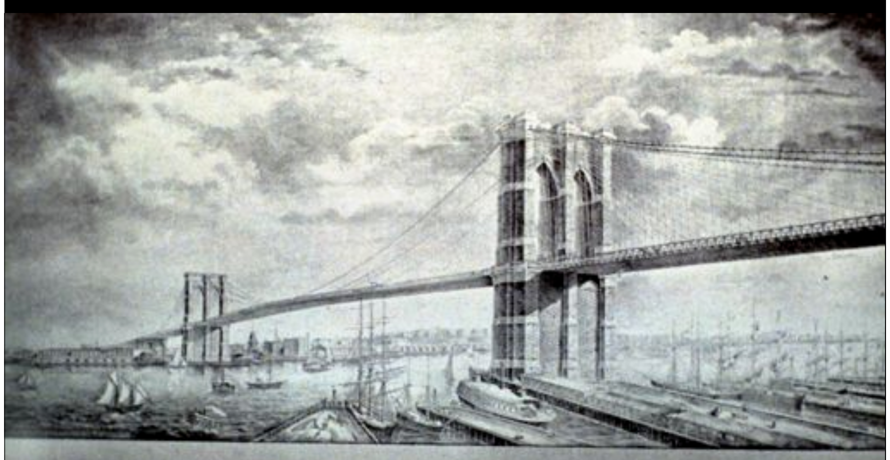
Draw a quick sketch of such a proposal



Flood tide below me! I see you face to face!
Clouds of the west – sun there half an hour high –
I see you also face to face

Crowds of men and women attired in the usual costumes,
how curious you are to me!
On the ferry-boats the hundreds and hundreds that cross, returning home,
are more curious to me than you suppose,
And you that shall cross from shore to shore years hence are more to me,
and more in my meditations, than you might suppose

-Crossing Brooklyn Ferry
Walt Whitman (1856)



JOHN ROEBLING'S DREAM—ORIGINAL DESIGN OF THE BROOKLYN BRIDGE

The contemplated work, when constructed in accordance with my designs, will not only be the greatest Bridge in existence, but it

will be the great engineering work of this continent, and of the age. Its most conspicuous features, the great towers, will serve as landmarks to the adjoining cities, and they will be entitled to be ranked as national monuments. As a great work of art, and as a successful specimen of advanced Bridge engineering, this structure will forever testify to the energy, enterprise and wealth of that community, which shall secure its erection.

Respectfully submitted,

JOHN A. ROEBLING.

TRENTON, N. J., Sept. 1st, 1867.

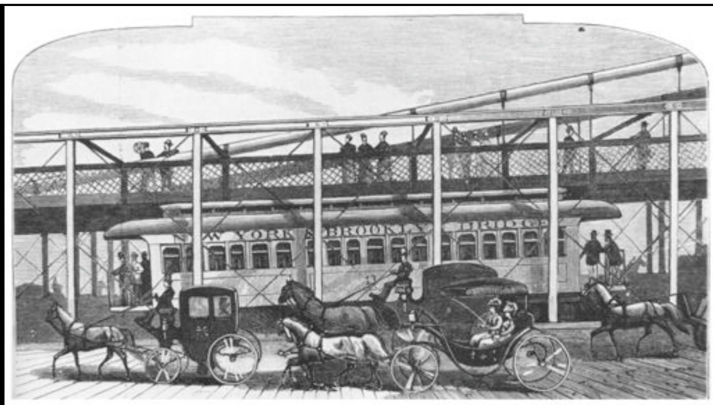
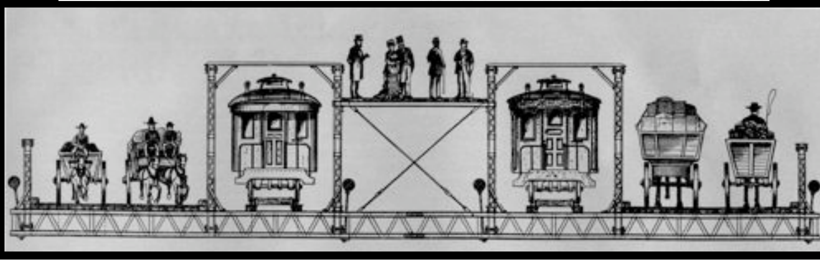
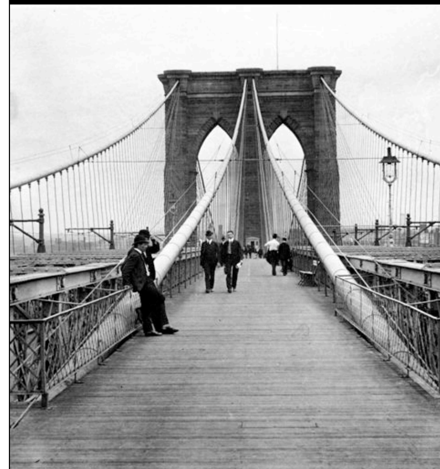
extensive system of stays forms the third. The stays are arranged in four distinct planes, connected by the floor. The latter in connection with the stays will support itself without the assistance of the cables. If the structure is viewed

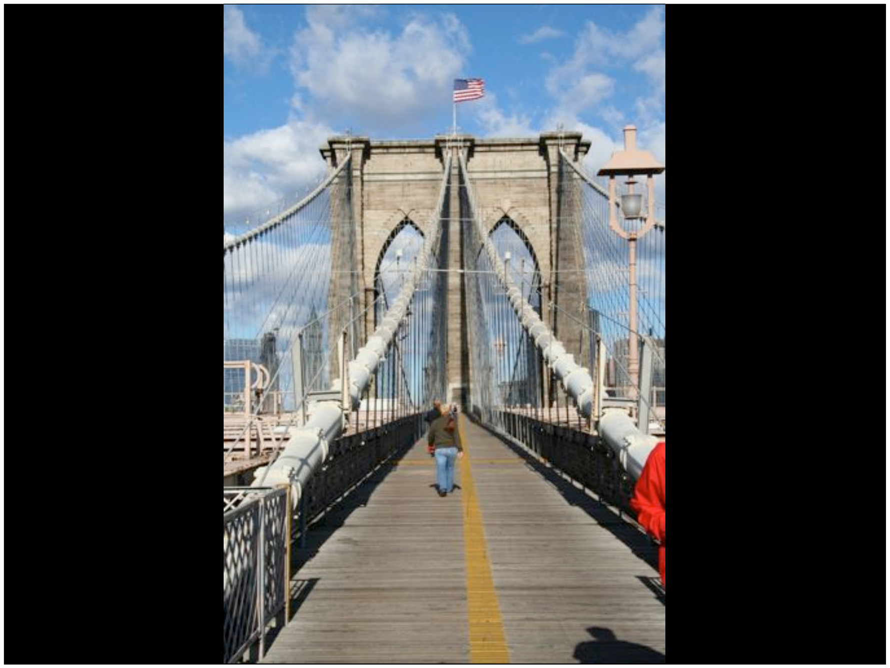


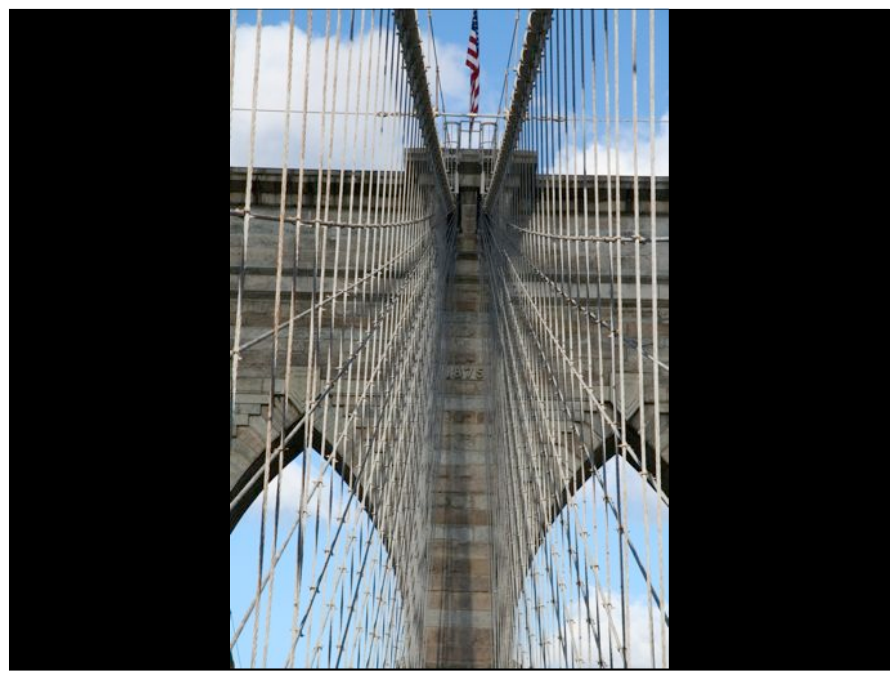




1888

2006





The Brooklyn Bridge was politically and economically significant because it joined the cities of New York and Brooklyn.

Can you think of other civil works that have had similar political and economic meanings?

Are there places you would propose such a construction?

Were the results positive, negative, mixed?

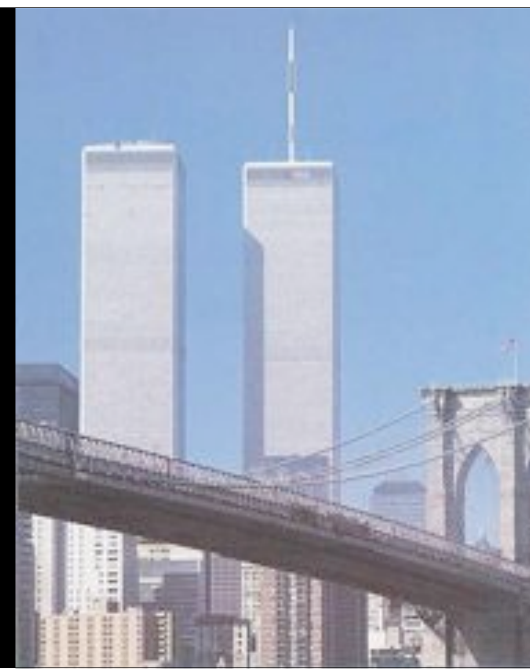
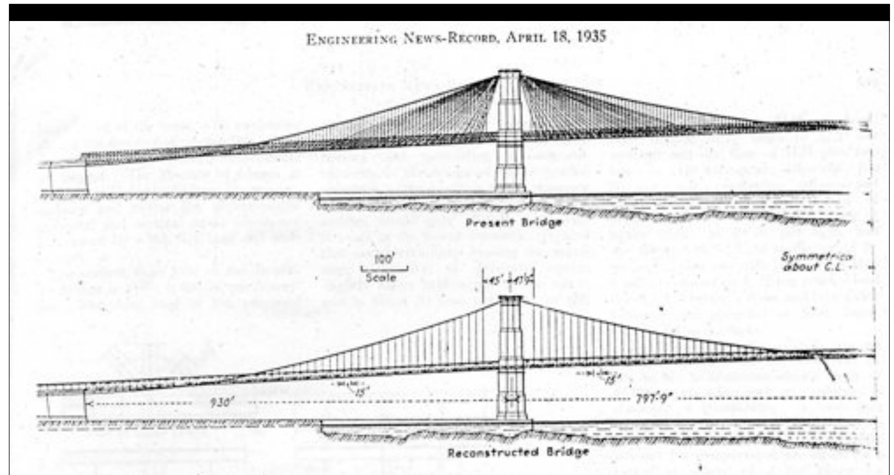
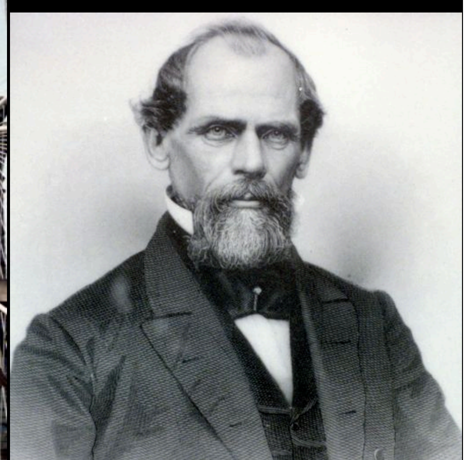
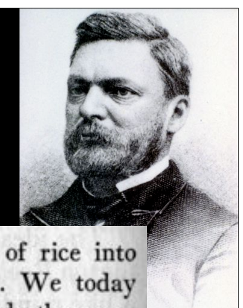
Again the traffic lights that skim thy swift
Unfractioned idiom, immaculate sigh of stars,
Beading thy path--condense eternity:
And we have seen night lifted in thine arms.
"The Bridge"
Hart Crane (1930)









To build his pyramid Cheops packed some pounds of rice into the stomachs of innumerable Egyptians and Israelites. We today would pack some pounds of coal inside steam boilers to do the same thing, and this might be cited as an instance of the superiority of modern civilization over ancient brute force. But when referred to the sun, our true standard of reference, the comparison is naught, because to produce these few pounds of coal required a thousand times more solar energy than to produce the few pounds of rice. We are simply taking advantage of an accidental circumstance.

It took Cheops twenty years to build his pyramid, but if he had had a lot of Trustees, contractors, and newspaper reporters to worry him, he might not have finished it by that time. The advantages of modern engineering are in many ways over balanced by the disadvantages of modern civilization.
